

"You're able to use it the next day. Perfect."

Geoff Gilbert, Gilbert and Son Butchers, Great Staughton

"We've been really impressed, it's very durable and easy to keep clean."

Jack Smallman, Southdowns Venison and Game

"The floor, now over 15 years old, is still performing exceptionally well."

Adam Webb, Delico Meats, Milton Keynes

The best Butchers, demand the best flooring
Acrylicon

The floor you can work on in just 90 minutes!

Unbelievable but true:

Acrylicon reaches full strength and can be fully operational just 90 minutes after installation.

We know that time means money for Butchers, and because of this Acrylicon has been leading the way in food and retail flooring for over 30 years. Our exceptional cure time means that installations and repairs can be carried out over night, with the floor being put back into FULL use just 90 minutes later. It also enables other trades to follow on much sooner, dramatically reducing project times and costs on major refurbishments.

Slip resistant

The surface texture of Acrylicon can be varied to provide different degrees of slip resistance depending on the application. Even when wet and greasy, Acrylicon floors will still comply with HSE guidelines, keeping your staff safe.

Hygiene and cleaning

All Acrylicon floors are completely non-porous throughout the system. This ensures a sealed hygienic floor with no pores or pinholes in which bacteria can proliferate. Acrylicon floors have full EEC and FDA food contact approval and have a similar cleanability to stainless steel and Teflon®. Coved skirting can be provided which is truly seamless with the floor and walls, leaving no dirt traps.

Performance

Acrylicon floors are extremely tough and durable. With traditional tiled flooring, heavy equipment or dropped meat hooks may chip or damage the tiles leading to delamination and unsightly floors. Acrylicon Systems are able to withstand this impact without cracking or delaminating. Even in extreme cases where the floor is damaged, with our unique 2 hour chemical cure, repairs are simple, effective and quick.

Permanent bond

Unlike other resin floors, which only mechanically stick to the substrate, Acrylicon chemically fuses to it and with itself – leaving a truly monolithic system from top to bottom. With no bond lines, delamination is a thing of the past. This unique ability to chemically bond means that any repairs or extensions will chemically seal back into the floor permanently. We can also bond to tiles, wood and metal decking in some instances.

Longest lasting

Acrylicon started laying its unique flooring systems in 1977. Since then, we have not changed the formula of our resins, only improved our laying techniques. It is a testament to the chemical composition of Acrylicon that our oldest jobs are still available to view. With a true life expectancy of 4-8 times that of other vinyl or resin floors, we offer fantastic value for money. Many of our customers have carried out little or no maintenance within the first 15 years.
